

90,000 Reasons to Choose Straumann® SLActive

Clinical experience shows that most implant failures occur at an early stage of implant placement. Therefore, it is important that you can give confidence to your patients at this critical point in time.

Straumann® SLActive, an innovative advancement in implant dentistry, has been specially developed to optimise implant stability and reduce the risk of failure. Our latest research findings substantially support the fact that, with over 90,000 implants sold, Straumann® SLActive implants deliver an extremely low failure rate of only 0.6%.

Manufactured from pure titanium, Straumann® SLActive implants feature optimal surface topography for bone cells to attach themselves, allowing osseointegration to occur twice as fast compared to conventional implant surfaces. This innovative surface treatment successfully reduces healing time to as little as four weeks, thus setting a new standard for tooth replacement and patient care.

As an integral part of the Straumann® Dental Implant System our revolutionary Straumann® SLActive guarantees the best possible treatment success in implant dentistry, delivering increased predictability and greater security to you and your patients.
