

## Precise Drill Depth Control - Straumann® Drill Stop

The Straumann® Drill Stop provides precise control over drilling depth during implant bed preparation for the placement of Straumann® dental implants.

The advantage of the Straumann Drill Stop lies in its ability to be applied in both simple and more advanced cases, where the location of the mandibular nerve or sinus floor are concerned.

Delivered in sterile sets the drill stops are ready to use. The Straumann Drill Stop is designed for single-patient use only and must be used in conjunction with the single-patient drills specifically designed for them.

### Additional safety

- **Restricts drilling deeper** than the predefined depth.
- **Fast and secure** mounting and dismounting of drill stops.

### Simple handling

- **Ready to use** – Drill stops are conveniently packaged for each depth and do not require cleaning or sterilization.
- **All drilling depths** are covered with a minimal selection of four drill stop types.
- **Color coding** allows easy identification of diameter size.

### Effective design

- **Small-sized** drill stops offer an optimum view of the treatment area.
- **Openings** on the drill stops facilitate irrigation and removal of bone chips.
